

Dynamic Regrouping Plans

Dynamic regrouping enables individuals from different talkgroups to be brought together to communicate in the case of special situations. This feature lets a supervisor or dispatcher change the talkgroup assignments of individual radios without any action required by the radio operators. Regrouping assignment can be initiated rapidly, but not instantaneously. For example, radios to be regrouped must be turned on, in range, and listening only to the control channel. Therefore, regrouping is best suited for preplanned activities or occasional changes from normal routine. It

is NOT intended for emergency responses such as high-speed chases or for rapid deployment on a per incident basis.
